

## ADOT - Modern Roundabouts Spiral Striping

Spiral stripes assist drivers in navigating through the roundabout by pushing them to the outside of the circulatory roadway preventing vehicles from being “trapped” in the inside lane.

By selecting the correct lane indicated for their desired destination at the entry to the roundabout, drivers are spiraled to their desired exit without having to make a lane change within the circulatory roadway.

Spiral stripes as used for left turning traffic at the entry prior to an entry that has dual left turns. This enables the motorist to enter in the inside lane and move to the outside lane at the appropriate place to safely exit from the outside lane.
