

ADOT STANDARD LINE STYLES

These apply to the following linestyles:

They are:

1. roadway.rsc - Refer to Linestyle Documentation
2. adot_e.rsc
3. rw_e.rsc
4. traf_e.rsc

These resource files have the same name as the current ADOT standard cel libraries, with the addition of an "_e" to the name to identify them as english line styles. All of the line styles within each Line Style Resource file have the same name as the cells that are used for patterning linear elements. However an "_e" has also been added to identify them as english line styles. For example, if you are looking for the line style for an existing hedge, you could refer to the index in the ADOT standards or on this web site, and see that the cel name is hdg and is in the adot.cel library. The corresponding line style would be hdg_e, which is in the adot_e.rsc resource file.

One note of caution, when using these line styles be aware that before placing them, you will still have to set the correct level, color and line weight as shown in the ADOT standards.
