**NOTES:**

1. All lids on existing pull boxes shall be replaced with polymer concrete lids if they are damaged, missing or specified to be replaced. The table above is to facilitate such replacement with information on the needed sizing. The replacement lids shall meet or exceed the requirements of the original installation.

2. It is acceptable for lids of one manufacturer to be used on a box body of another material type and/or manufacturer as long as the lid fits properly and is able to be secured. If the lid cannot be secured bolted down the Engineer may direct that the box body be replaced also.

3. "Fit properly" means that the lid seats and seals into the box body so that the top surface of the lid is flush with the box edge.

4. The sizing (the A, B, & C dimensions), required load rating, and type of lid hold-down bolt system shall be field verified by the contractor prior to ordering replacement lids. Each pull box installation shall be checked.

5. The replacement lid shall, at a minimum, conform to all the applicable requirements of the most current version of the Society of Cable Telecommunications Engineers (SCTE) Specification for Underground Enclosure Integrity ANSI/SCTE 77. In addition to the required chemical-resistance requirements the lid shall also be resistant to a 5% solution of ice mitigation salt Magnesium Chloride. The box lid, as a minimum, shall have an ANSI/SCTE 77 Tier load rating as indicated in the table. The lid shall be marked or labeled in a manner that confirms its compliance with the applicable ANSI/SCTE 77 requirements.

6. Existing No. 3½ boxes shall be replaced with new No. 5 boxes unless noted otherwise on the plans.

7. All lid hold-down hardware shall be stainless steel or galvanized steel.

8. Lid markings shall be 1" letters (1/4") that are cast, molded, or engraved or plaque'd.
